

Advancing State-of-the-art Log Analytics Infrastructures

Weiyi Shang

<http://users.encs.concordia.ca/~shang/>

Software system failures are often due to performance issues rather than functional bugs

PERFORMANCE

Software Engineering for Ultra-large-scale Systems

The background of the slide is a photograph of a large, white, inflatable structure. The structure is shaped like a long, low building with a flat roof. On the side of the structure, there is a large, white, cloud-shaped logo with the Amazon logo and the text "amazon web services". To the right of this logo, there is a sign that says "Cloud Access" with two curved arrows pointing towards each other. In the foreground, several people are walking around the structure. One person is carrying a white shopping bag with the "canias" logo. There are also some blue and white striped chairs in the foreground.

Amazon's massive AWS outage on Feb. 28th 2017 took more than 4 hours to recover.

Logs are one of the only resources of information during load testing

Abstract

The goal of a load test is to uncover functional and performance problems of a system under load. Performance problems refer to the situations where a system suffers from unexpectedly high response time or low throughput. It is difficult to detect performance problems in a load test due to the absence of formally-defined performance objectives and the large amount of data that must be examined.

In this paper, we present an approach which automatically analyzes the execution logs of a load test for performance problems. We first derive the system's performance

tors which mimic clients sending thousands or millions of concurrent requests to the application under test. During the course of a load test, the application is monitored and performance data along with execution logs are recorded. Performance data store resource usage information such as CPU utilization, memory, disk I/O and network traffic. Execution logs store the run time behavior of the application under test.

The goal of a load test is to uncover functional and performance problems under load. Functional problems are often bugs which do not surface during the functional testing process. Deadlocks and memory management bugs are

Automatic Identification of Load Testing Problems

Performance Engineering
Research In Motion (RIM)
Waterloo, ON, Canada

Abstract

Many software applications must provide services to hundreds or thousands of users concurrently. These applications must be load tested to ensure that they can function correctly under high load. Problems in load testing are due to problems in the load environment, the load generators, and the application under test. It is important to identify and address these problems to ensure that load testing results are correct and these problems are resolved. It is difficult to detect problems in a load test due to the large amount of data which must be examined. Current industrial practices

requires one or more load generators which mimic clients sending thousands or millions of concurrent requests to the application under test. During the course of a load test, the application is monitored and performance data along with execution logs are stored. Performance data record resource usage information such as CPU utilization, memory, disk I/O and network traffic. Execution logs record the run time behavior of the application under test.

Load testing is an area of research that has not been explored much. Most work focuses on the automatic generation of load test suites [11, 12, 13, 14, 16, 20, 29]. However,

Leveraging general compressors on log data

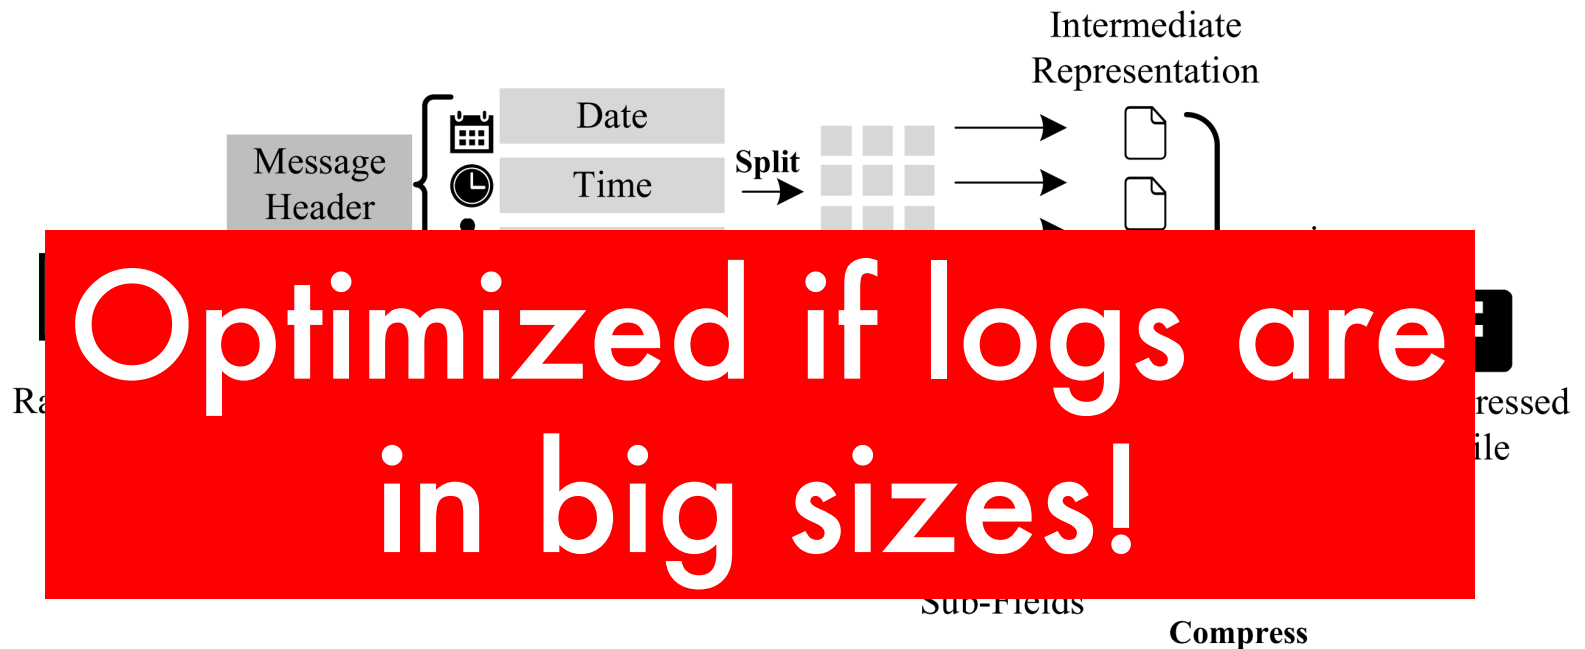

Cannot achieve optimal performance!

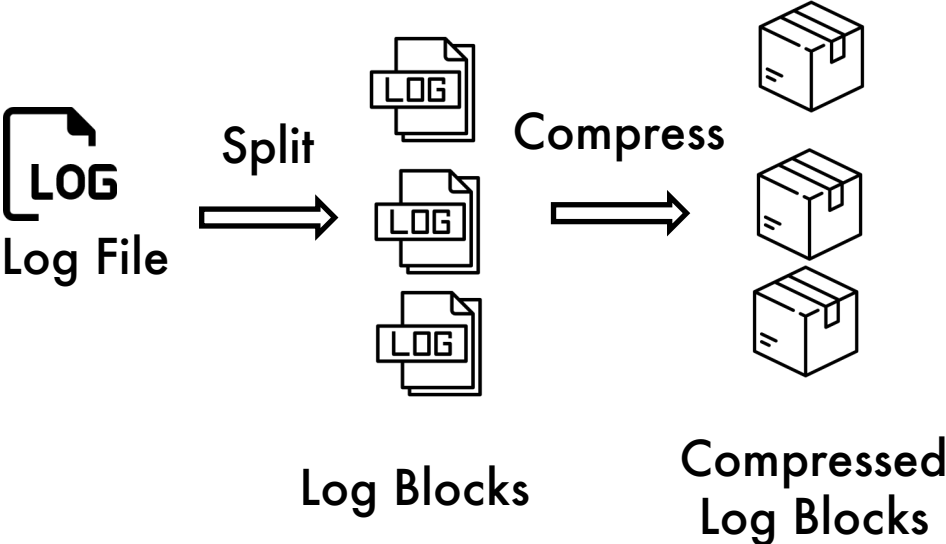

Leveraging general compressors on log data

Logzip: Extracting Hidden Structures via Iterative Clustering for Log Compression

Logs are typically stored in small blocks

Apache **LOG4J**  **LOGBack**™ *The Generic, Reliable, Fast & Flexible Logging Framework*   **log4net**
Time/Size-based log rolling

 **Stack**
16KB/60KB

splunk >
128KB

 **DATADOG**
256KB

 **HUMIO**
384KB ~ 1024KB

sumo logic
64KB

 **NGINX**
64KB

Logzip does not perform well on small log blocks.

- Do not have enough data to accurately extract template
- Not enough repetitiveness
- Preprocessing largely impact speed (up to 42s to compress a 128KB log block)
- Inter-file repetitiveness not used

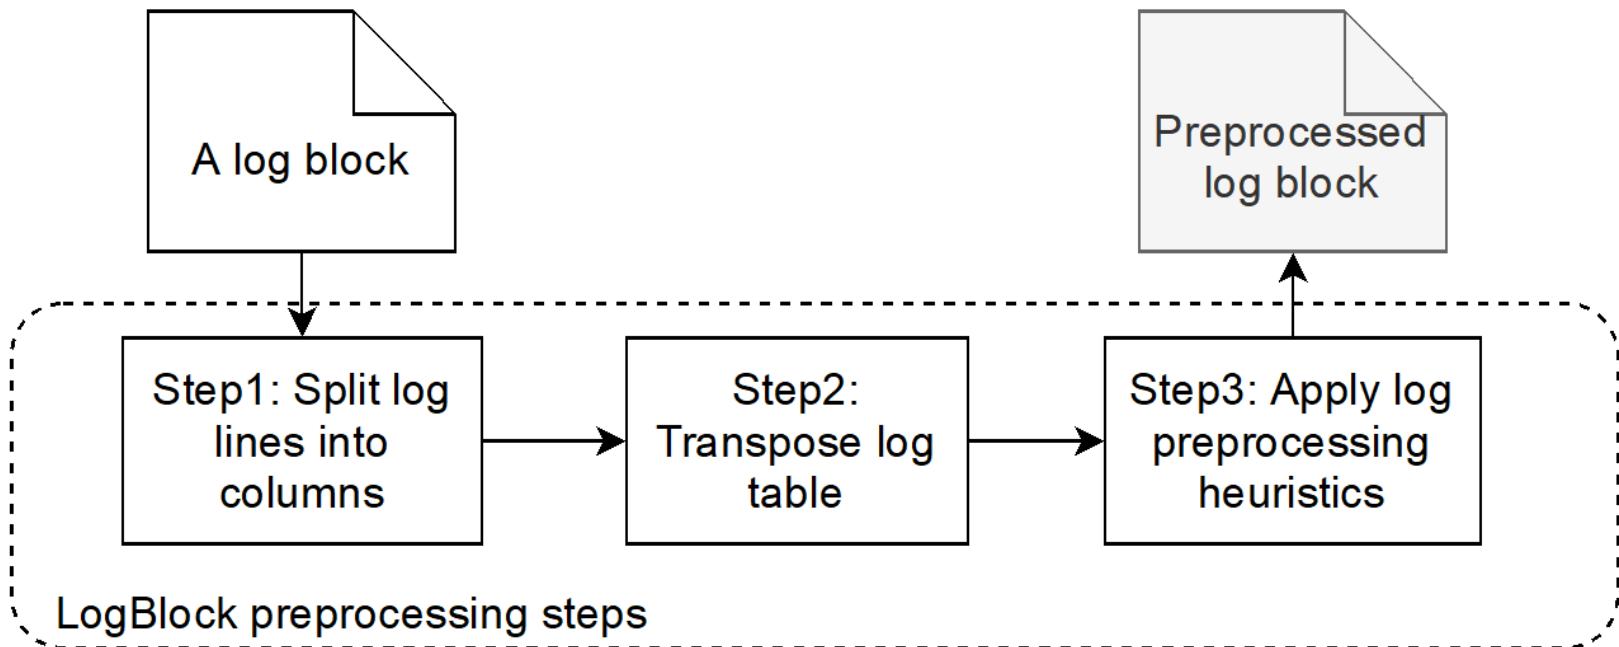

The compression ratios of Logzip are 4% to 98% (by a median of 63%) of the compression ratio without it.

Initial investigation on log data

We observe 4 types of repetitiveness from the non-content part of our selected log data.

- **T1: Identical tokens:** Tokens with the same information (e.g., Year component).
 - H1: **Extract identical tokens:** Extract the identical token and its number of occurrences.
- **T2: Similar numeric tokens:** Long & numeric tokens (e.g., Timestamp).
 - H2: **Delta encoding for numbers:** Save the delta between the current token and its prior token (first token preserved).
- **T3: Repetitive tokens:** Few tokens repeating a lot. (e.g., Log level)
 - H3: **Build dictionary for repetitive tokens:** Build a dictionary for each identical token and replace tokens with their indexes.
- **T4: Tokens with common prefix string:** Tokens start with the same information (e.g., Module).
 - H4: **Extract common prefix string:** Save the prefix string and store the remaining part of each token.

Design of our preprocessing approach: LogBlock

We do not perform extra information reduction steps to log content part for compression performance concern.

LogBlock's preprocessing example

Line	Year	Log level	Log content
1	2015	WARN	Send worker leaving thread
2	2015	INFO	Received connection request 1
3	2015	WARN	Send worker leaving thread

LogBlock improves the compression ratio on small log blocks

Our approach is 31.0 to 50.1 times faster than Logzip in preprocessing and compressing small-sized log blocks.

Our approach improves the compression ratio by a median of 5%, 9%, 15% and 21% on 16KB, 32KB, 64KB, and 128KB blocks in comparison to compression without any preprocessing.

Efficiency is an important concern for log parsing

The main task of log parsing

Raw log (Unstructured)	Found block rdd_42_20 locally Found block rdd_42_22 locally Found block rdd_42_23 locally Found block rdd_42_24 locally
-----------------------------------	--

The main task of log parsing

**Raw log
(Unstructured)**

```
Found block rdd_42_20 locally  
Found block rdd_42_22 locally  
Found block rdd_42_23 locally  
Found block rdd_42_24 locally
```

static

dynamic

The main idea of Logram

Raw log
(Unstructured)

```
Found block rdd_42_20 locally  
Found block rdd_42_22 locally  
Found block rdd_42_23 locally  
Found block rdd_42_24 locally
```

Each **static token** has a higher number of appearance.
Token "Found" appears 4 times.

Each **dynamic token** has a lower number of appearance.
Token "rdd_42_20" appears only once.

The goal of log parsing is to identify whether a token is a **static** token or a **dynamic** token

The main idea of Logram

Raw log
(Unstructured)

```
Found block rdd_42_20 locally  
Found block rdd_42_22 locally  
Found block rdd_42_23 locally  
Found block rdd_42_24 locally
```

Each **static token** has a higher number of appearance.
Token “**Found**” appears 4 times.

Each **dynamic token** has a lower number of appearance.
Token “**rdd_42_20**” appears only once.

We use the number of appearances to distinguish **static** and **dynamic** tokens.

The main idea of Logram

Raw log (Unstructured)	Expecting attribute name [0x800f080d - CBS_E_MANIFEST_INVALID_ITEM] Failed to get next element [0x800f080d - CBS_E_MANIFEST_INVALID_ITEM]
-----------------------------------	--

A **dynamic** token may also appear frequently.

The main idea of Logram

Raw log (Unstructured)	Expecting attribute name [0x800f080d - CBS_E_MANIFEST_INVALID_ITEM] Failed to get next element [0x800f080d - CBS_E_MANIFEST_INVALID_ITEM]
-----------------------------------	--

If we consider 3-grams instead of individual token, each 3-gram only appear once.

A **dynamic** token may also appear frequently.

Step 1: Dictionary setup for n-grams

A Survey on Automated Log Analysis for Reliability Engineering

SHILIN HE, Microsoft Research
PINJIA HE, Department of Computer Science, ETH Zurich
ZHUANGBIN CHEN, TIANYI YANG, YUXIN SU, and MICHAEL R. LYU, Department of Computer Science and Engineering, The Chinese University of Hong Kong

Logs are semi-structured text generated by logging statements in software source code. In recent decades, software logs have become imperative in the reliability assurance mechanism of many software systems because they are often the only data available that record software runtime information. As modern software is evolving into a large scale, the volume of logs has increased rapidly. To enable effective and efficient usage of modern software logs in reliability engineering, a number of studies have been conducted on automated log analysis. This survey presents a detailed overview of automated log analysis research, including how to automate and assist the writing of logging statements, how to compress logs, how to parse logs into structured event templates, and how to employ logs to detect anomalies, predict failures, and facilitate diagnosis. Additionally, we survey work that releases open-source toolkits and datasets. Based on the discussion of the recent advances, we present several promising future directions toward real-world and next-generation automated log analysis.

CCS Concepts: • Software and its engineering → Software maintenance tools; Software creation and management.

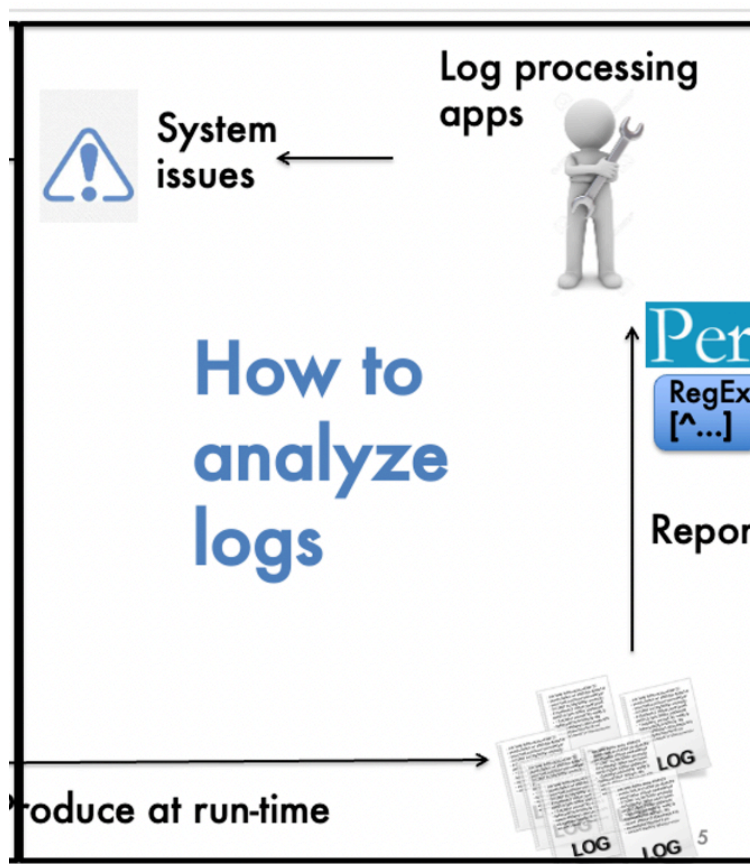

Very successful research area

Focusing on the ease of practitioners' adoption

Limited generalized toolsets in practice

Goal: Making log analytics as easy/low-cost as possible

Domain specific language for Log analytics

Log analytics as services

Accessible log analytics during development

Logging analytics infrastructure

Log processing apps

Compression

Raw log (Unstructured)	<code>{17/06/09 20:11:11;INFO;storage.BlockManager: Found block;rdd_42_20;locally}</code>
---------------------------	---

Parsed log (Structured)	Timestamp: 17/06/09 20:11:11; Level: INFO Logger: storage.BlockManager Static template: Found block <*> locally Dynamic variable(s): rdd_42_20
----------------------------	--

Parsing

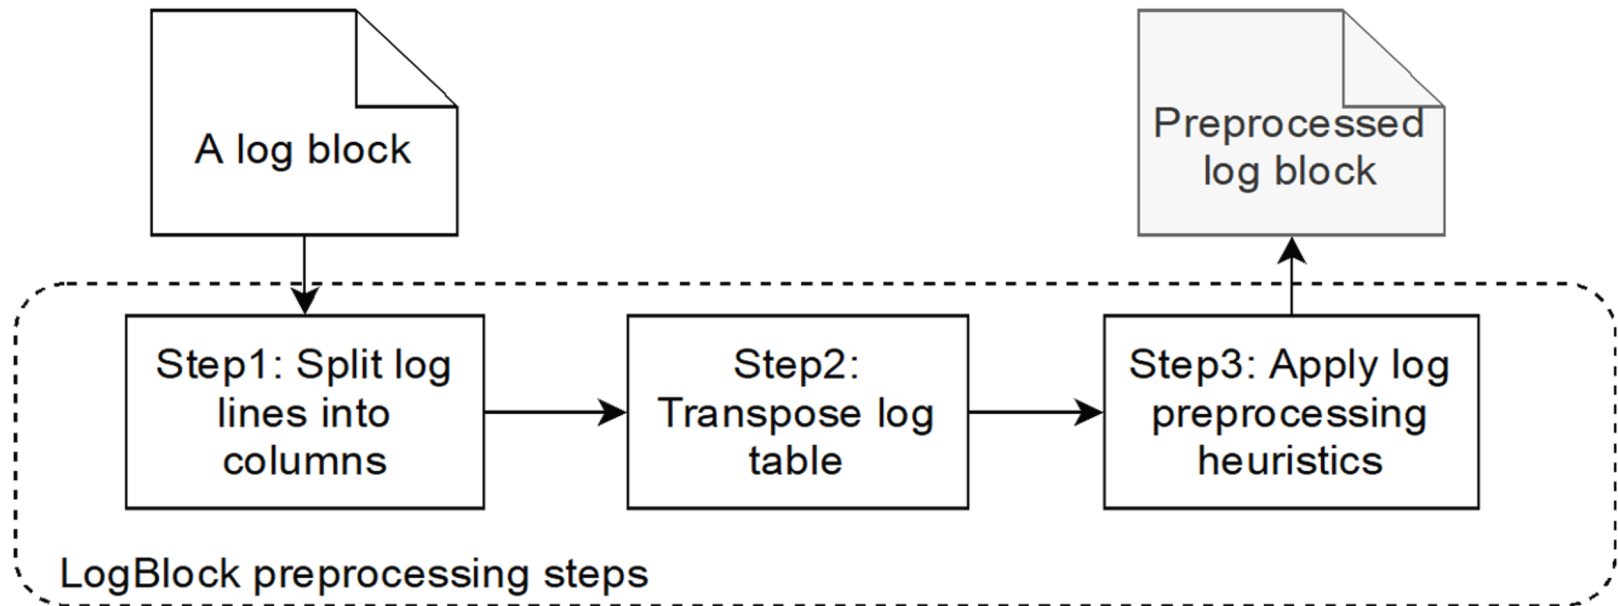

Release

Produce at run-time

Design of our preprocessing approach: LogBlock

We do not perform extra information reduction steps to log content part for compression performance concern.

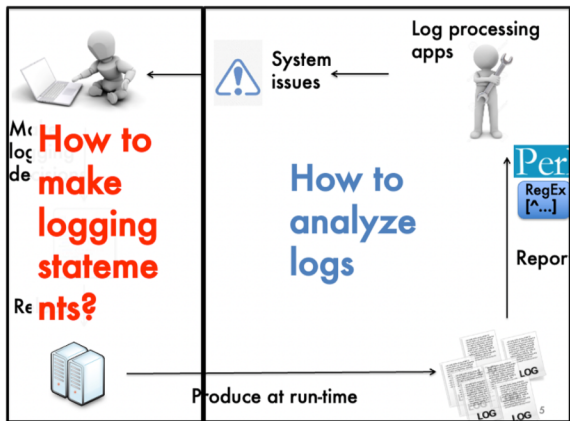

The main idea of Logram

Raw log (Unstructured)	<pre>Found block rdd_42_20 locally Found block rdd_42_22 locally Found block rdd_42_23 locally Found block rdd_42_24 locally</pre>
-----------------------------------	--

Each **static token** has a higher number of appearance.
Token **"Found"** appears 4 times.

Each **dynamic token** has a lower number of appearance.
Token **"rdd_42_20"** appears only once.

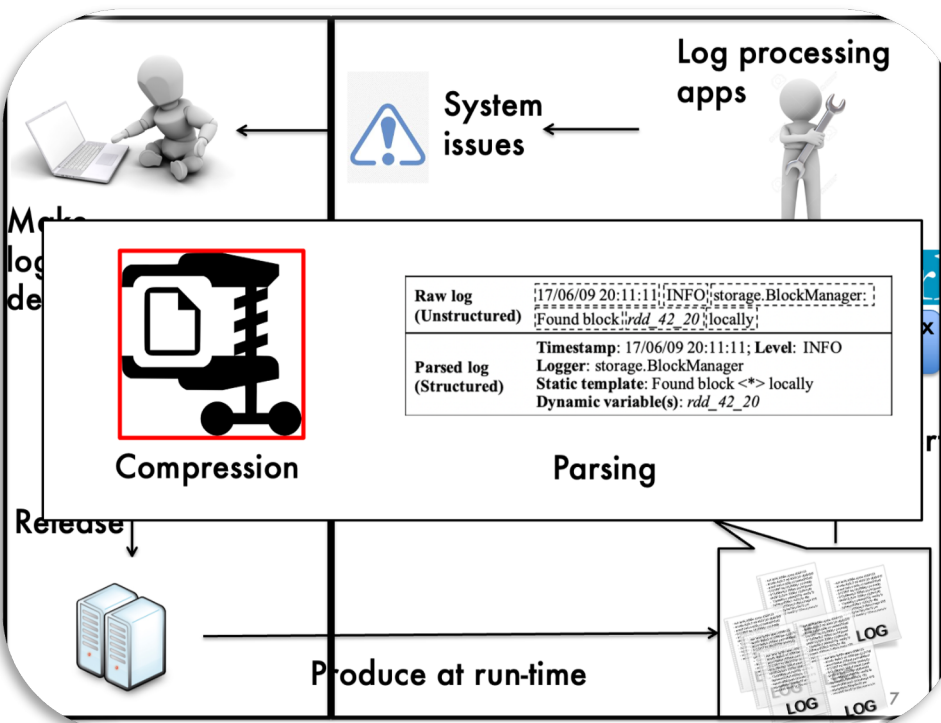

We use the number of appearances to distinguish **static** and **dynamic** tokens.

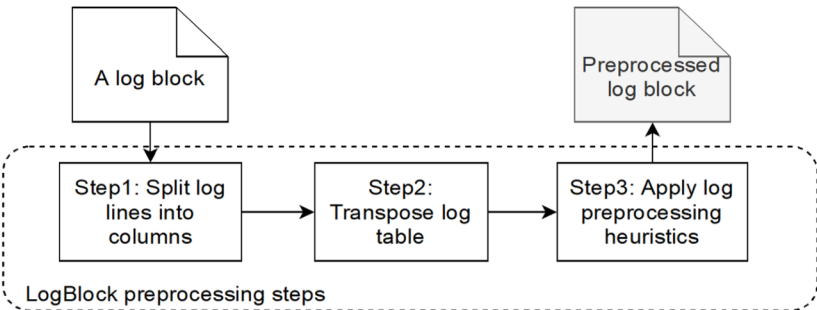

How to make logging stateful?
Reports?

Design of our preprocessing approach: LogBlock

We do not perform extra information reduction steps to log content part for compression performance concern.

The main idea of Logram

Raw log (Unstructured)	<pre> Found block:rdd_42_20,locally Found block:rdd_42_22,locally Found block:rdd_42_23,locally Found block:rdd_42_24,locally </pre>
------------------------	--

Each static token has a higher number of appearance.
Token "Found" appears 4 times.

Each dynamic token has a lower number of appearance.
Token "rdd_42_20" appears only once.

We use the number of appearances to distinguish static and dynamic tokens.

CSRankings: Computer Science Rankings

CSRankings is a metrics-based ranking of top computer science institutions around the world. Click on a triangle (▼) to expand areas or institutions. Click on a name to go to a faculty member's home page. Click on a chart icon (the 📊 after a name or institution) to see the distribution of their publication areas as a bar chart. Click on a Google Scholar icon (🔍) to see publications, and click on the DBLP logo (📄) to go to a DBLP entry. Applying to grad school? Read this first. Do you find CSRankings useful? Sponsor CSRankings on GitHub.
